

How to deliver an application to the Apple Mac Store

- Make sure you have the correct provisioning profiles installed in Organiser. Also check provisioning profile in System Preferences -> Profiles.
- Create high res iconset. Make a folder named UnityPlayer.iconset (or whatever your info.plist is setup to show) with the following image names inside. Make sure the folder has the .iconset extension.

```
icon_16x16.png
icon_16x16@2x.png
icon_32x32.png
icon_32x32@2x.png
icon_128x128.png
icon_128x128@2x.png
icon_256x256.png
icon_256x256@2x.png
icon_512x512.png
icon_512x512@2x.png
```

- Make sure that the @2x images are sized 2X the image the name says. So 512x512@2x is actually a 1024x1024 image with 144 dpi. From the Terminal, navigate to the directory where the .iconset directory is located and perform the command

```
iconutil -c icns UnityPlayer.iconset
```

- Create an `info.plist` and an `GAMENAME.entitlements` file. The easiest way to do this is by using <http://jemast.com/unity/unity-entitlements-tool> to generate them for you. You can also extract the `info.plist` from the Unity generated `.app` and modify that one. The most basic `GAMENAME.entitlements` looks like this, it will make sure your app runs in the Apple sandbox. This one has no iCloud support:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plist PUBLIC "-//Apple//DTD PLIST 1.0//EN" "http://www.apple.com/DTDs/PropertyList-1.0.dtd">
<plist version="1.0">
<dict>
<key>com.apple.security.app-sandbox</key> <true/>
</dict>
</plist>
```

- Fix Macbook Pro Retina fullscreen problems (see <http://forum.unity3d.com/threads/145534-Mountain-Lion-MacBook-Pro-Retina-gt-problem-for-Unity-games>) by adding something like this. It only needs to be called once! It will create a flicker since it goes out and in fullscreen.

```
if (Screen.fullScreen)
{
    //MacBook Pro Retina 15: width = 2880 , height = 1800
    //could check device model name, but not available in Unity
    //if last resolution is almost retina resolution, toggle fullscreen
    var resolutions : Resolution[] = Screen.resolutions;
    if (resolutions.length > 0)
    {
        Screen.fullScreen = false;
        yield(0.01f);
        Screen.fullScreen = true;
        yield(0.01f);
    }
}
```

- Enable `UseMacAppStoreValidation` toggle in the `PlayerSettings`
- Run Unity and build the `.app`
- Replace the `iconset.icns` with the created one in Step 2 by right clicking the `.app` and `Show Contents`
- (Optional) Replace the `UnityPlayerIcon` in the `.app` with your own
- Replace the `info.plist` in the `.app` with the modified one from Step 2.
- Fix read permissions on all the content in the `.app`. In the Terminal type:

```
chmod -R a+rx "/path/to/GAMENAME.app"
```

- Sign the .App with the created entitlements from Step 3. In the Terminal type:

```
codesign -f -s '3rd Party Mac Developer Application'
```

- Build the installer/pkg. In the Terminal type:

```
productbuild --component GAMENAME.app /Applications
```

- Submit using the ApplicationLoader! Make sure your *application_id* in iTunesConnect is in the *waiting for upload* state.
